

Self Learning Project

INM420SAA – Miguel Santos

1. Did you achieve your goal? Was it easier or harder than expected?

Yes, I achieved my goal. However, it was a little harder than expected because I underestimated the number of functions I wanted to add. I kept adding more and more features to make it a fully functional web app, which made the process more complex than I initially planned.

2. If it didn't work, why not? What happened? What resources did you use to try and figure it out? What did you learn from it not working?

N/A, the project worked out very well.

3. What would you do different next time?

Next time, I would fully plan and sketch my ideas for the web app to ensure that I am not missing any core functionality. At the start, I thought my only task was to code the dragging functionality, but I completely forgot to plan how users would add tasks to the list and how the app should handle different scenarios, such as incomplete input fields. Having a clearer plan from the beginning would help streamline development and avoid such oversights.
